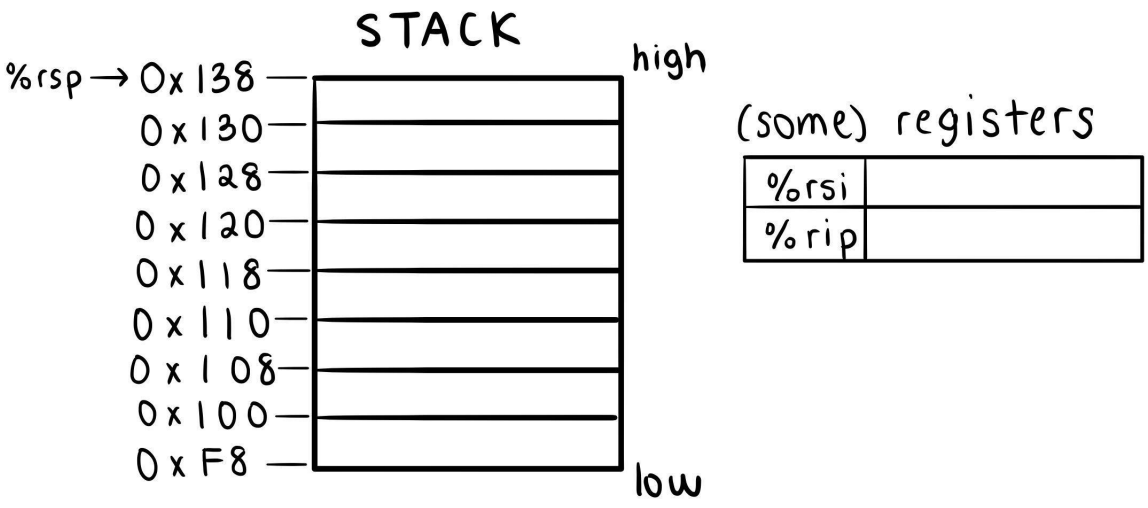
1. Consider the following disassembled function:

```
000000000040102b <phase_2>:
  40102b:  55                    push   %rbp
  40102c:  53                    push   %rbx
  40102d:  48 83 ec 28           sub    $0x28,%rsp
  401031:  48 89 e6              mov    %rsp,%rsi
  401034:  e8 e3 03 00 00        callq  40141c <read_six_numbers>
  401039:  83 3c 24 01           cmpl   $0x1,(%rsp)
  …
```

i) Assume %rsp initially has a value of 0x138. Draw the stack (see example diagram below) for the execution of <phase_2>, updating the stack and register values as necessary after each line is executed.



ii) Right after the callq instruction has been executed, what are the values of %rsp, %rsi, and %rip?

2. What will the following print out?

```
typedef struct {
      char shookie;
      int tata;
      char cookie;
      double chimmy;
} bt;

void main(int argc, char** argv){
      bt band[7];
      printf( "%d\n", (int)sizeof(band));
}
```

3. What is the best* ordering of the following data types if you want to have a struct that uses all of them? What is this optimal size? Assume a 64-bit architecture.

** the ordering that will result in the optimal usage of space – there's more than 1 answer!*

```
char tully;
long stark;
float* lannister;
double targaryen;
int greyjoy;
float arryn;

struct Westeros{
      /* order the above variables here */

};
```

4. Consider the following disassembled function:

```
000000000040102b <phase_2>:
  40102b:  55                   push   %rbp
  40102c:  53                   push   %rbx
  40102d:  48 83 ec 28          sub    $0x28,%rsp
  401031:  48 89 e6             mov    %rsp,%rsi
  401034:  e8 e3 03 00 00       callq  40141c <read_six_numbers>
  401039:  83 3c 24 01          cmpl   $0x1,(%rsp)
  …
```

Right after the callq instruction has been executed, what address will be at the top of the stack?

5. Consider the following C code:

```
typedef struct {
      char first;
      int second;
      short third;
      int* fourth;

} stuff;

stuff array[5];

int func0(int index, int pos, long dist) {
      char* ptr = (char*) &(array[index]._____);
      ptr += pos;
      *ptr = _____ + dist;

      return *ptr;
}

int func1() {
      int x = func0(1, ____, _____);
      return x;
}
```

Clearly some code is missing - your job is to fill in the blanks! Note that the size of the blanks is not significant. The two functions will be compiled using the following assembly code:

```
0000000000400492 <func0>:
  400492:  8d 04 17             lea    (%rdi,%rdx,1),%eax
  400495:  48 63 ff             movslq %edi,%rdi
  400498:  48 63 f6             movslq %esi,%rsi
  40049b:  48 8d 14 7f          lea    (%rdi,%rdi,2),%rdx
  40049f:  88 84 d6 60 10 60 00 mov    %al,0x601060(%rsi,%rdx,8)
  4004a6:  0f be c0             movsbl %al,%eax
  4004a9:  c3                   retq

00000000004004aa <func1>:
  4004aa:  c6 05 cb 0b 20 00 0d movb   $0xd,0x200bcb(%rip)
                                          # 60107c <array+0x1c>
  4004b1:  b8 0d 00 00 00       mov    $0xd,%eax
  4004b6:  c3                   retq
```
